

AI Glossary

Algorithm: It is a step by step approach to add inspire and solve problem in a finite time.

Code Combat: It is a free coding educational game that teaches you to learn JavaScript or Python coding in a fun way

Control structures: Control structures are set of instructions that controls the flow of instructions in a program.

Data Acquisition: It means collecting raw data from the purpose of reference or analysis for the project.

Data Visualization: It is an easier way to understand the trends and patterns in data by using graphical presentation tools like charts and graphs.

Data Modeling: It is the process of designing decision making algorithms that has to be trained on a set of data and apply that learning to recognize certain types of patterns.

Deep Learning: It is a machine learning algorithm that is inspired by the functionality of our brain cells called neurons.

Decision Trees: These are the tools that follow a rule-based approach that uses a tree-like model of decisions and their possible consequences.

Flowchart: Flowchart is a graphical representation of an algorithm that makes use of symbols which are connected through arrow to show the direction of the flow of information.

Human Machine Interaction HMI: It can be defined as the communication or interaction between the humans and patients where user interface to perform a specific task or operation.

Intelligence: It is the ability to learn from experience, to recognize problems an solve problems.

Variational Auto Encoders: A variational auto encoders(VAE) is a generative AI Algorithm that uses deep learning to generate new content, detect anomalies and removes noise.

Python: it is a general-purpose, object oriented, easy to learn, and high-level programming language.

Virtual Assist: It is an application that we use to control our smartphone is a prime explanation of AI impacting our daily life.
